变频器输出dv/dt为3000V/us根据屏蔽电缆分布参数，不会发生行波反射的临界长度一般为15m左右，则不加输出电抗器。工程上因为电缆的分布参数不一致，伺服驱动器输出的dv/dt要比3000V/μS大许多，所以不加电抗器建议电缆长度为10m.超过10m,建议加1%的输出电抗器。

The dt/dv the inverters output is 3000V/μS. According to the distribution parameters of the shielded cable, the critical length of traveling wave reflection is about 15m. If the cable is less than 15m, the output reactor can be spared.Due to the inconformity of the distribution parameters of cables in the engineering, the dt/dv the servo drivers output is much larger than 3000V/μS, so it is advised that reactors with 1% voltage drop should be used if the cable length is more than 10m.
